## 11321 Sort! Sort!! And Sort!!!

Hmm! Here you are asked to do a simple sorting. You will be given $N$ numbers and a positive integer $M$. You will have to sort the $N$ numbers in ascending order of their modulo $M$ value. If there is a tie between an odd number and an even number (that is their modulo $M$ value is the same) then the odd number will precede the even number. If there is a tie between two odd numbers (that is their modulo $M$ value is the same) then the larger odd number will precede the smaller odd number and if there is a tie between two even numbers (that is their modulo $M$ value is the same) then the smaller even number will precede the larger even number.

For remainder value of negative numbers follow the rule of C programming language: A negative number can never have modulus greater than zero. E.g. -100 MOD $3=-1,-100 \operatorname{MOD} 4=0$, etc.

## Input

The input file contains 20 sets of inputs. Each set starts with two integers $N(0<N \leq 10000)$ and $M(0<M \leq 10000)$ which denotes how many numbers are within this set. Each of the next $N$ lines contains one number each. These numbers should all fit in 32-bit signed integer. Input is terminated by a line containing two zeroes.

## Output

For each set of input produce $N+1$ lines of outputs. The first line of each set contains the value of $N$ and $M$. The next $N$ lines contain $N$ numbers, sorted according to the rules mentioned above. Print the last two zeroes of the input file in the output file also.

## Sample Input

## 153

1

## Sample Output

## 153

15
