## 11701 Cantor

The ternary expansion of a number is that number written in base 3. A number can have more than one ternary expansion. A ternary expansion is indicated with a subscript 3 . For example, $1=1_{3}=0.222 \ldots 3$, and $0.875=0.212121 \ldots 3$.

The Cantor set is defined as the real numbers between 0 and 1 inclusive that have a ternary expansion that does not contain a 1. If a number has more than one ternary expansion, it is enough for a single one to not contain a 1.

For example, $0=0.000 \ldots 3$ and $1=0.222 \ldots 3$, so they are in the Cantor set. But $0.875=0.212121 \ldots 3$ and this is its only ternary expansion, so it is not in the Cantor set.

Your task is to determine whether a given number is in the Cantor set.

## Input

The input consists of several test cases.
Each test case consists of a single line containing a number $x$ written in decimal notation, with $0 \leq x \leq 1$, and having at most 6 digits after the decimal point.

The last line of input is 'END'. This is not a test case.

## Output

For each test case, output 'MEMBER' if $x$ is in the Cantor set, and 'NON-MEMBER' if $x$ is not in the Cantor set.

## Sample Input

0
1
0.875

END

## Sample Output

MEMBER
MEMBER
NON-MEMBER
