## Problem I: Intersecting Semi-Circles Time Limit: 5 seconds

## Description

There are $\mathbf{n}$ points on $X$-axis, and their coordinates are $(1,0),(2,0), \cdots,(\mathbf{n}, 0)$.
The color of the point is $(\mathbf{i}, 0)$ is $\mathbf{a}_{\mathbf{i}}$. If two points have the same color, then a semi-circle centered at their midpoint on the X-axis, connecting them, is drawn with color $\mathbf{a}_{\mathbf{i}}$ in the first quadrant (this is thus the top half of the circle, with these two points on the diameter). Compute the number of intersections where 2 arcs of different colors intersect modulo 1000000007.

## Input

A number of of inputs $(\leq \mathbf{1 5 0})$, each starting with $\mathbf{n}$ on a line, followed by a line with $\mathbf{n}$ numbers $\mathbf{a}_{\mathbf{i}}\left(1 \leq \mathbf{n} \leq 100000,1 \leq \mathbf{a}_{\mathbf{i}} \leq 100000\right)$.

## Output

For each input, output the answer on one line.

## Sample Input

1
1
8
12312321

## Sample Output

0
8
