

## 386 Perfect Cubes

For hundreds of years Fermat's Last Theorem, which stated simply that for  $n > 2$  there exist no integers  $a, b, c > 1$  such that  $a^n = b^n + c^n$ , has remained elusively unproven. (A recent proof is believed to be correct, though it is still undergoing scrutiny.) It is possible, however, to find integers greater than 1 that satisfy the "perfect cube" equation  $a^3 = b^3 + c^3 + d^3$  (e.g. a quick calculation will show that the equation  $12^3 = 6^3 + 8^3 + 10^3$  is indeed true). This problem requires that you write a program to find all sets of numbers  $\{a, b, c, d\}$  which satisfy this equation for  $a \leq 200$ .

### Output

The output should be listed as shown below, one perfect cube per line, in non-decreasing order of  $a$  (i.e. the lines should be sorted by their  $a$  values). The values of  $b$ ,  $c$ , and  $d$  should also be listed in non-decreasing order on the line itself. There do exist several values of  $a$  which can be produced from multiple distinct sets of  $b$ ,  $c$ , and  $d$  triples. In these cases, the triples with the smaller  $b$  values should be listed first.

The first part of the output is shown here:

```
Cube = 6, Triple = (3,4,5)
Cube = 12, Triple = (6,8,10)
Cube = 18, Triple = (2,12,16)
Cube = 18, Triple = (9,12,15)
Cube = 19, Triple = (3,10,18)
Cube = 20, Triple = (7,14,17)
Cube = 24, Triple = (12,16,20)
```
